

The Product

An online web portal to deliver the most up to date interview questions, experiences and UCLA class relevancy to the tech community at UCLA through curation of posts from the very same community. The aim is to guide UCLA students to their dream jobs at their dream companies with help from those that have already walked the very same path.

The Objective

Build out a web application to cater to the tech interviewees - future software engineers, product managers and designers - by providing a smooth and community driven platform that people continue to use and contribute to freely. The application should be launched by the end of Spring 2017, with a heavy push mid summer just before the behemoth of applications in Fall 2017.

The Tech Stack

- Backend - GoLang because of its speed, efficiency and minimalism.
- Frontend - React because of its modularity and eventual portability to React Native for mobile development in the future.

The Team

1 extra Go developer to assist myself in the backend development, 2 frontend engineers and 2 designers to complement each other's abilities.
